

Report2Web Bundler

Making web-based report distribution a reality.

What is Report2Web Bundler?

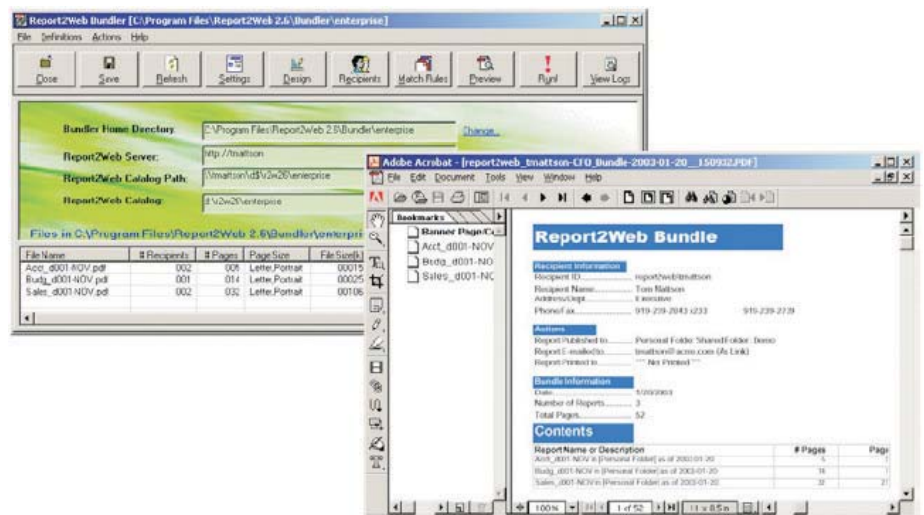

Report2Web Bundler creates personalized report bundles to suit individual end-user requirements. Instead of searching through reams of irrelevant output dispersed across multiple print files, end-users only need open their report bundle to find all the information they need to perform a particular task. Immediately, users become more productive through browser-based access to information that is specific to their requirements. Personalized report bundles, featuring bookmark links to each document, make the information easier to digest. Efficiency improvements are realized through the presentation and analysis of related pieces of business information alongside each other. For example, budget details contained in separate cost center reports are automatically bundled for analysis by a divisional manager. In addition to being automatically published, report bundles can be created for distributed printing, faxing and emailing with Report2Web Bundler.

Report2Web Bundler provides the following benefits:

- Delivers the automatic bundling of application output for publishing to individual recipients
- Provides seamless access to all related business information within a single report
- Improves end-user productivity eliminating the need to wade through irrelevant data
- Saves on costs incurred through the printing of multiple copies of the same report
- Aggregates reports from multiple sources and simplifies report management
- Reduces the costs of manual distribution and mailing of reports

How does it work?

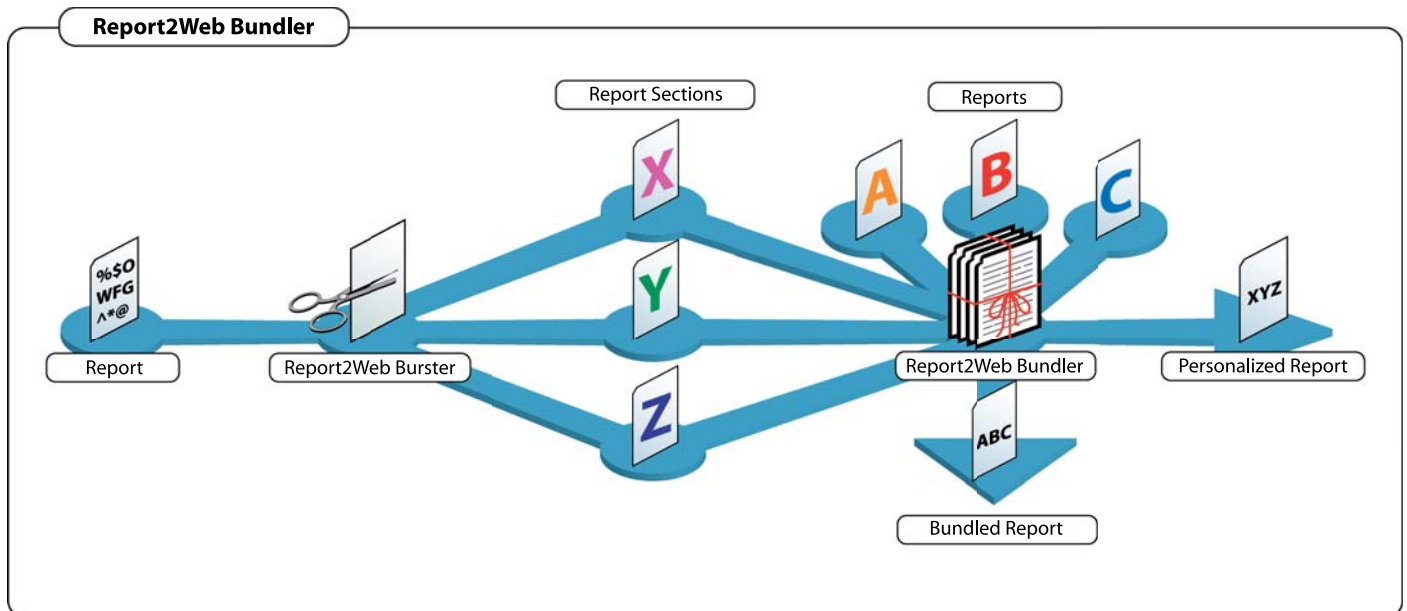

Report2Web Bundler merges input reports in PDF format into a single PDF file. This output file contains a bundled report for publishing or delivery to a specific user or group of users. Source documents originating from core business applications, including ERP, CRM and mainframe systems, as well as PageMart™ documents are automatically converted to PDF prior to being delivered to Report2Web Bundler's input folder. Administrator defined rules match input reports with their target bundles, while recipient criteria and action definitions determine who is to receive each bundle and how it is to be delivered. Output files are created with PDF bookmarks as well as banner header and content pages. In addition to bundling input reports into personalized documents for publishing via Report2Web, documents can be automatically printed or emailed with Report2Web Bundler.

Multiple reports are bundled into one complete report with Report2Web Bundler.

Report2Web Bundler

Making web-based report distribution a reality.

Automatic report bundling

Report2Web Bundler automatically processes reports based on administrator defined rules. As soon as all the reports required for a new bundle become available, Report2Web Bundler is automatically dispatched to collate component reports into a personalized bundle. Report2Web Bundler can be scheduled to execute during off-peak hours, enabling the aggregation of reports coming from source systems. This automated technique for combining and routing reports is an extremely effective way to ensure that users across the organization get the data they need, when they need it.

Seamless integration with Report2Web Burster

In many organizations, monolithic reports detailing all business unit activity must be split into separate reports. Report2Web Burster handles this task with ease, automatically splitting reports into smaller reports based on their content. Of course, once the information is split into separate reports, it usually needs to be regrouped into sets of reports that serve the needs of certain users. That's where Report2Web Bundler comes in. When Report2Web Burster is finished splitting

report data into the appropriate individual reports, Report2Web Bundler can then combine those reports with others to meet the requirements of specific users. Not only can Report2Web Burster write files directly to Report2Web Bundler for processing, it can also pass out bundle recipient details, allowing Report2Web Burster to dynamically define bundle recipients based on report content. Improved report navigation Bookmarks incorporated into bundled documents simplify navigation, providing Report2Web end-users with immediate access to the first page of each individual report within a bundle. As well as creating a banner page and contents page, Report2Web Bundler inserts PDF bookmarks into each bundle, which appear in the Acrobat viewer.

Flexible publishing options

Report2Web Bundler is flexible, offering a variety of publishing options and delivery methods. A bundle can be configured to be published to one or more Report2Web folders, sent to a certain printer; or delivered via email, either through a secure Report2Web link, or as an attachment. Through a wide range of publishing options, Report2Web Bundler enables an organization to utilize a

common solution in communicating information in a format that suits individual end-user needs.

Banner Page Designer

Customize the presentation of report bundles with personalized banner pages. The Banner Page Designer enables the definition of banner page templates, which feature recipient information and a contents section summarizing bundle content as well as graphics, lines, text, and colors. Through matching each banner page template with an associated recipient definition, Report2Web Bundler will dynamically construct the appropriate banner page for each bundle it creates. Bundled reports with a professional look and feel, conforming to corporate standards and policies are easy to produce with Report2Web Bundler.
